

# 6 Reasons for Hexacone®

The inner portion of the implant is perfectly sealed with the cone at the level of the bone.

Crestal reverse conus (CRC) prevents the manifestation of periimplantitis.

The Osmoactive® surface leads to rapid ion exchange after insertion and protects against bacteria.

The crestal threads were developed to provide for additional bone condensation:  
• The implant functions as an ostetome in the bone.

The apical cutting edges easily cut themselves into the bone.

Abutments are available for Platform Offset®.
