tapered system

Tapered Pro predictable, immediate results

Immediate implant treatment requires predictability. Tapered Pro implants have been developed based on over 10 years of tapered implant success. The unique design elements provide a predictable solution for immediate treatment.

design features include:

- tapered body and aggressive threads provide primary stability
- end cutting, self-tapping thread design for controlled implant placement in challenging sites
- reduced collar diameter preserves vital bone
- unique Laser-Lok microchannels create connective tissue attachment and retain crestal bone, allowing better control of esthetic outcomes
